

(A) Instantaneous amplitude $A(t)$ at $T\approx 35.1$ yr [scale $s\approx 33.5$, Morlet $\omega_0=6$]
 If Triptych model is correct: $A(t)$ should decline post-1945

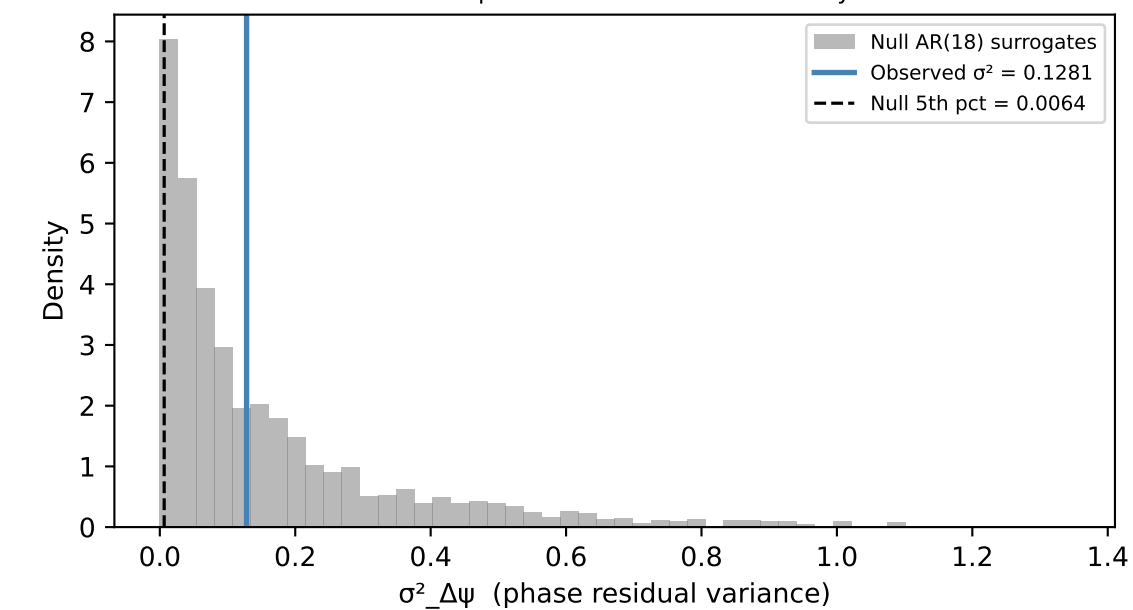

(B) Wavelet power scalogram (Morlet, $\omega_0=6$)
 Hatched: cone of influence (edge-affected region)

(C) Instantaneous phase at $T\approx 35.1$ yr
 20 AR surrogates shown (red) vs. observed (blue)

(D) Phase variance — 192 obs, AR(18)
 $p_{\sigma^2} = P(\text{null} \leq \text{obs}) = 0.5975$ [n.s.]
 Small $\sigma^2 \rightarrow$ phase stable $\rightarrow$ evidence for cycle

(E) Phase coherence R — 192 obs, AR(18)
 $p_R = P(\text{null} \geq \text{obs}) = 0.5980$ [n.s.]
 $R \rightarrow 1$: phase coherent $\rightarrow$ evidence for cycle
